Information Security Policy

We are a purely Czech, dynamically growing software company that develops and implements specialized software solutions for retail. We're using the latest knowledge, trends and technologies into our products, where we rely on their use in analysing business issues and putting systems into practice. Last but not least, we also rely on high qualifications and the serious approach of all company employees to our customers.

In order to fulfil the objectives of the policy, we are constantly improving the effectiveness of the information security management system. And this with the support of all our employees and suppliers, to whom we provide regular training to increase their expertise.

The protection of personal and company information of our customers as well as our own information is an absolute priority for us. Therefore, we take a number of comprehensive and balanced measures with the aim of preventing leaks of sensitive data and important assets. We also focus on ensuring data availability, integrity and confidentiality.

We are committed to complying with all legal regulations, regulatory and contractual security requirements. We are working hard to increase the security level of protected data and reduce the level of risk resulting from risk analysis.

Compliance with the information security management system applies not only to persons working for or on behalf of our company, but also to all persons who, with our knowledge, move around our workplaces or our premises. We also apply this policy to suppliers of products, services and external resources.
